COMPUTER PROGRAMMING

LAB 3

LAB TITLE

Relational Operators, Logical Operators and Conditional Statements in C++

1. Objective

The objective of this lab is to understand how **relational operators, logical operators, and conditional statements** work in C++. We learn how to compare values and make decisions in a program using **if, if-else, and else-if statements**.

---

2. Theory

In C++, programs normally run step by step. Sometimes we need the program to make decisions based on conditions. For this purpose, C++ uses **relational operators, logical operators, and conditional statements**.

Relational operators compare two values such as `<`, `>`, `==`, and `!=`.

Logical operators combine conditions such as `&&` (AND), `||` (OR), and `!` (NOT).

Conditional statements like **if, if-else, and else-if** help the program execute different actions depending on the condition.

---

3. Software

- DEV-C++ IDE
- C++ Compiler

Conclusion

In this lab, we learned how to use **relational and logical operators** and how **conditional statements** help a program make decisions. These concepts are important for writing logical programs in C++.
